The Children's Hospital
BOSTON

FOR THE YEAR
1914

BOSTON
1915

The Children's Hospital

BOSTON

Extends to children, not over twelve years of age, medical and surgical treatment, without regard to sex, race, creed or color.

THE OUT-PATIENT DEPARTMENT

IS OPEN TO PATIENTS AS FOLLOWS

(Except on Sundays and legal holidays)

MEDICAL - - - Every day—9 to 10.30 A.M.

SURGICAL - - - Monday, Tuesday, Wednesday, and
Saturday—2 to 4 P.M.

ORTHOPEDIC - Monday, Tuesday, Wednesday, and
Saturday—2 to 4 P.M.

THROAT - - - Monday, Tuesday, and Wednesday—
2 to 4 P.M.

NERVOUS - - - Wednesday and Saturday—2 to 4 P.M.

Patients requiring admission to the wards should be referred to the proper division of the Out-Patient Department, but urgent cases can be received at any time by direct application to the Hospital.

REPORT

OF

THE BOARD OF MANAGERS

THE new buildings of The Children's Hospital (practically completed at the time the last report was published) were fully occupied during the month of June, after a period of transfer and adjustment during which the problems to be met in changing from the old quarters to the new were various and troublesome. The thanks of the Managers are due to the Building Committee and to the Superintendent and her assistants for the zeal and skill with which they were met.

The effect both on the quantity and quality of the work done was immediate and so great as to show the pressing need which existed for better accommodations. During the months from September to December, the number of patients treated in the wards increased 44 per cent. and the out-patient visits increased 36 per cent. in comparison with the same months of the previous year.

The heads of the laboratory departments of the Harvard Medical School have met us with the most cordial coöperation, and as members of the staff, since our arrival in the new Hospital, have enabled us to make the fullest use of our new laboratories and operating rooms to the great advantage of the patients.

Attention is called to the complete description of the new Hospital which immediately follows the Treasurer's Report and also to the reports from the various Medical and Surgical Departments in which a full description of the present conditions of the work may be found.

Unfortunately, it is true that high efficiency is very expensive, that the increase in patients means many new employees, and finally, that the months during which both the new and the old buildings were necessarily in partial use were very costly. We have spent, therefore, \$20,000 more than our normal income and that, too, after most careful scrutiny of all expenses and after making every possible saving.

It would be a real loss both to the community and the medical profession were the Hospital compelled to curtail its work. We have, therefore, decided to help those who come to us (and their number already almost reaches the building's capacity) relying on the generosity of the public and upon a general realization of the fact that the welfare of the children of this community is of the greatest importance to every citizen of Boston.

The Managers desire to record their appreciation of the work of the Sisters of Saint Margaret, and also to give their most hearty thanks to Messrs. C. E. Cotting, C. W. Whittier, C. F. Bancroft, and George B. DeBlois for valuable expert advice. They also acknowledge gratefully the receipt of the legacies or additions to the Endowment Fund, the list of which follows.

FRANCIS H. BROWN,
Secretary.

Boston, January 27, 1915.

LIST OF LEGACIES AND ENDOWMENTS RECEIVED DURING THE YEAR 1914

From:

Estate of Lucy F. Simmons.....	\$1,606.94

DESCRIPTION OF THE NEW HOSPITAL.

The *main building* of The Children's Hospital commemorates separate gifts. The building for out-patients at the corner of Vila street, adjoining the administration building on the west is the gift of Mr. Francis W. Hunnewell. The Home for Nurses on the east of the administration building is built from money left for the purpose by Anne White Vose. These main buildings are fireproof throughout, and are five stories in height. The different parts are separated by fire walls. The exterior of the building is a concrete conglomerate consisting of crushed trap rock, sand and Portland cement, having a natural gray color.

As one enters the *administration building* on the street floor through the patients' entrance, there are on each side of the hall reception rooms and small examining rooms and bath rooms for patients. To these rooms the parents bring their children when sent by their physicians to be admitted to the wards, and in these rooms the administrators of the hospital arrange with the parents for the admission of the children while the house physicians and surgeons obtain the history of the illness and make a complete examination of the child. Off the main hall also is a dressing room for medical students.

Behind the main hall, but not connecting with it, are the kitchen, pantries, refrigerators and store room, as well as the dining rooms for the maids and for the male attendants. All of these rooms are reached from the rear of the building and from the yard, where all supplies are received.

On the street floor, also opening off the main hall, is the Library, which it is expected will in time become a complete reference library dealing with the diseases of children, and which will be a meeting place for the alumni of the hospital, and a place of study for students and physicians who may wish to avail themselves of its opportunities. It is the purpose of the staff that this library shall be of the widest possible usefulness. The stack room, in which all the case records are kept, adjoins

it, so that any one studying cases may easily obtain the needed records. Close by is provided a room for the stenographer, who may also act as a librarian.

A staff room, with the necessary lockers, connects the library with the out-patient building.

On the main floor of the administration building are the executive offices, reception rooms, and the superintendent's suite. The Roentgenological department lies between the out-patient department and the administration building. It is the gift of Mrs. Weld. It contains a small waiting room for out-patients, coil and tube rooms, developing and store rooms, and office. It is so arranged that house patients and out-patients do not come in contact, a measure of precaution against contagious disease.

Most of the second floor is devoted to the house officers' quarters, though in the front there are the Chapel and the Managers' room.

The third floor has rooms for the Ladies' Aid Association in the front. In the rear of the third and fourth floors are three floors for the maids, their rooms being reached by a special stairway and elevator in the rear of the building.

The fourth floor is devoted to rooms for private patients, together with the necessary parlor, play room, diet kitchen and service rooms. There are rooms for a mother and child, rooms for a child alone and rooms for three or four children. Opening off the ward are large balconies on both the front and back of the building. All the floors are easily reached by the large central stairways and elevators.

In the *Nurses' Home* are rooms for seventy nurses, together with five rooms for the Sisters in charge of the Hospital. There are also the reception rooms, sitting and dining rooms, lecture rooms, library and recreation rooms. The fifth floor provides quiet rooms for night nurses, and an isolated suite for use in case of illness. A special elevator connects all the floors.

The *out-patient building* was planned with reference to the special needs of the several departments. The patients enter on the street floor. All who enter at once pass by the desk of the administrator. If it is the first visit of the patient provisional assignment is made to the proper department, and a ticket

is given to the patient to be kept permanently. At later visits the number of the patient's ticket is taken by the administrator and is sent by an automatic carrier to the recorder, who in turn gets from the stack the history record and sends it in a lift to the proper department. Thus the chief of each division has at his hand the complete record of all the patients whom he is called upon to see during the day. The patients are then passed to the various departments, an elevator carrying them to the proper floor.

If there is suspicion of any contagious disease, in the corner of the building directly behind the desk of the administrator is a suite of three isolation rooms, to which patients may be sent till examined by the physician, and from which they may leave by a special exit if the disease proves contagious. On this same floor are the social service rooms and dispensary for drugs, also suites of small examining rooms and bath rooms, to which children admitted to the wards from the out-patient department are sent. These rooms adjoin and supplement those for the examination of patients sent for admission from outside physicians.

On the main floor are the orthopedic and surgical departments, with their waiting rooms. The orthopedic department contains the examining and plaster rooms, the surgical department, the examining and operating rooms.

On the second floor are the medical and nerve departments and their waiting rooms. The medical department contains the necessary examining rooms, weighing rooms and laboratories, and the nerve department examining and treatment rooms.

The third floor is devoted to the scoliosis and throat clinics. For the former there are the necessary waiting rooms and dressing rooms for the patients, and rooms for exercises and corrective treatment, together with the necessary rooms for the director and teachers.

The throat department has on this floor its examining rooms, etherizing, operating, and recovery rooms. Rooms are also provided for future use for an eye and ear clinic. On the fourth floor is a small ward for throat cases obliged to remain over night in the hospital.

The Surgical Appliance Shop is located in the rear on the street floor, and has its forge and machine rooms, plaster and leather rooms.

The laundry occupies a low detached building behind the Nurses' Home.

The main building is planned for a hospital ultimately to contain four hundred patients. Each of the three departmental wings may be extended backward if necessary. The construction of the building is such that any of the minor partitions may be removed and altered without difficulty.

All the patients except those in the private rooms and in the small ward are housed in the *pavilion wards* and to the south of the main building, hidden away among green grass and shrubbery, of which the passerby on the street has no idea.

The pavilion wards at present are four in number, two of two stories and two of one story, accommodating thus one hundred and twenty patients. The plot of ground on which they are placed is irregular in shape, but the wards are so located as to get the maximum of fresh air and sunshine.

They are reached by a circulating corridor, which has three levels. The lowest is for necessary pipes and heating appliances. The second is half above grade, and is designed for the carriage of food and supplies to the wards. The food is carried on motor trucks in warm containers directly from the kitchen in the rear of the main building through these closed corridors to the several wards. The upper level corridors are for general passages between the several buildings. They are roofed over, and where necessary are screened by glass sash from the weather, and heated by steam. The flat roof of the corridors would serve in an emergency as a fire escape.

The pavilion wards are built of steel and wood covered by rough cast. In the planning of the wards three points were kept constantly in mind, (1) ventilation, (2) out-door treatment, and (3) the control of contagious disease.

Ventilation.—No known system of artificial ventilation is entirely satisfactory. Air may be heated or cooled, dried or moistened, filtered, pumped into or drawn out of a ward and still the air lacks the quality called freshness. It is essential in order to secure really fresh air that windows be open, and

open windows derange all artificial ventilating systems. The most satisfactory natural ventilation is secured by the passage of used air directly out through openings at the top of the room. It is further essential that spaces of non-circulating dead air be eliminated. These two objects have been attained by wards with monitor tops and sloping ceilings. The transom windows in each side of the monitor top are easily controlled by mechanism below. In the two-story wards the monitor form is retained in both the upper and lower floor. The ventilation of the lower story is not interfered with in the least by this arrangement, because the outer wall between the eaves of the lower story and the floor of the second story is merely an open lattice between the necessary supporting columns. Thus the out-door air has free access to the windows in the monitor top. The balconies of the second floor, though wide, are so high above the windows of the first story as not to shut off the sunlight.

The problem of securing *out-door treatment* has also been met most successfully. The wide windows on the southerly side of each ward extend to the floor and slide back so that the beds may be easily pushed out on to the piazzas, which on the lower floors are fifteen feet broad. These wide piazzas are covered for half their width, but contrary to the usual custom the roof is over the outer rather than over the inner half. In this way the low running winter sun shines over the piazza roof, entering freely into the wards, as it is desired that it should. The hot summer sun running well toward the zenith does not shine far into the wards under any circumstances. On the other hand, whatever breezes there may be to temper the summer heat circulate more freely under the piazza roof and into the wards when the roof is not close against the building. The sole objection to the plan lies in the exposure to rain in moving the children back and forth across the unroofed strip of piazza. This objection has not proved of any importance. In an extremely sudden summer shower it might require quick work on the part of the nurses.

In addition to the wide piazzas at the front and a narrow piazza at the back, there is at each end of the ward a large sun room which may be used as a play room by convalescents, or

may be used in bad weather for out-door treatment of delicate children.

Limitation of contagious disease is one of the problems which constantly confronts the administrators of a children's hospital. Our experience in the old building abundantly proved the need of limiting the size of the open wards. It was early concluded that no ward should contain more than ten beds, and that for each ten beds there should be one isolation room. The building of glass partitions between the beds was considered, but was not adopted. If children are up and walking about the value of the partition must be slight. The partitions do two things: First, they prevent direct contact between children in adjoining beds, but if the children are kept recumbent direct contact is impossible even without partitions. The second object of the partitions is to prevent attendants from carrying infection from patient to patient. The partition renders this relatively difficult, and serves as a reminder to the forgetful or careless. It is felt that rigid discipline and careful training will serve the same purpose.

The hospital has been in use now for eight months. The results in the limitation of contagion have been gratifying. The most trying experience so far has been with vulvo-vaginitis, which is without any question practically invariably carried from patient to patient by the hands of careless attendants or by any unclean utensil which comes in contact with the patients, including wash cloths, towels, napkins, diapers, thermometers, syringes, bed pans, and all bed and body clothing. The experience of this hospital has repeatedly shown that this disease can be completely checked by rigid care.

The isolation rooms have proved of great value. Any patient may at once be transferred to this room pending a decision on the question of contagion. In case quarantine is necessary the small number involved does not for long materially affect the efficiency of the hospital.

As a matter of economy in construction, in space and in administration, each ward was made double, each half complete in itself, and each half the exact duplicate of the other.

The desk for the head nurse is placed in the center of the lobby between the two ward units. From her chair she can

see every bed in each ward unit, the two sun parlors, the two isolation rooms, each diet kitchen, and the passage of persons to and fro from the service portions of the ward. Thus every thing goes on directly under the eye of the head nurse, and at night everything passes directly under the supervision of the night nurse. Thus the work is simplified as much as possible.

In case it is necessary to isolate either half of a ward it can be entered from out of doors and access cut off entirely from the main corridor. And as before stated, as each half of a ward is complete in itself perfect isolation is possible.

The greatest possible care is taken to prevent the admission of children with or exposed to contagion. The parents are questioned carefully. The daily reports of the Board of Health are posted in the admitting rooms. The small examining and bath rooms give opportunity for thorough examination. If contagious disease breaks out in a ward the physician in charge of contagious diseases at once assumes control, acting of course in conjunction with the visiting physician or surgeon.

The *operating rooms* are in a special building. At one end of this is an amphitheatre seating 83, with a separate students' entrance from outside. This amphitheatre is planned rather for lectures and demonstrations than for ordinary operations. It is equipped with a lantern, and can be darkened easily by electrically controlled shades. At the same time it is amply equipped for any surgical operation should it be desirable to demonstrate anything before a large company.

Ordinarily all the operating is done in four smaller rooms, designed especially to give students a good view of what is being done. Low galleries at a height of six feet and four inches above the floor are placed at the sides of the rooms. In each of these galleries six persons may sit, and at least six may stand and look over the shoulders of those sitting. Thus twenty-four persons may look almost directly down upon the field of operation and be only a few feet away. Large screens of plate glass placed at an angle in front of the seats prevent dirt from passing down on to the tables or patient. The front walls of these balconies are solid up to the height of the knee below the glass screens. A hand rail protects the glass. One of these operating rooms is used for plaster of Paris work. One is isolated for

operations in septic cases. Near the operating rooms are the necessary dressing rooms, etherizing and recovery rooms, supply, instrument and sterilizing rooms.

On the second floor of the surgical building are the quarters for the male help, and a photograph room.

On the lower floor below the operating rooms and on a level with the amphitheatre floor are the morgue, and the laboratories for the visiting pathologist, bacteriologist and chemist.

The future growth of the hospital will come at first through the building of two new wards and the addition of another story to the two one-story wards already built. These additions will provide one hundred and twenty ward beds, making two hundred and fifty in all in the pavilion wards. The location of these wards is already determined. There is additional ground on which may be built another pavilion ward, a ward for private patients, or a contagious ward, as may in the future seem best.

REPORT OF THE TREASURER

STATEMENT OF INCOME AND EXPENDITURES FOR THE YEAR 1914

Received from:

Donations and subscriptions.....	\$19,980.50
Interest.....	42,492.11
Sales of drugs.....	1,245.16
Board of patients.....	13,660.19
Sales of surgical appliances.....	8,420.78
Throat Department—representing balance collected during several years.....	7,540.95
School of Nursing.....	4,033.36
X-Ray.....	1,384.83
Sundries.....	863.65
Charitable Surgical Appliance Shop in lieu of rent.....	100.00

Disbursed for:

Payment under will of George E. Downes.....	\$83.33
Payments under F. W. Hunnewell Indenture of October 21, 1909.....	1,000.00
Interest on demand notes.....	3,346.41
Insurance and repairs.....	3,749.95
Surgical appliances purchased and repaired.....	8,125.17
Drugs.....	4,203.71
Gift to Sisters of Saint Margaret....	1,500.00

House Expenses:

Supplies.....	\$29,112.59	
Fuel.....	8,136.79	
Wages.....	35,833.23	
Printing and stationery.....	2,667.22	
Petty cash.....	310.00	
Annual Report.....	831.99	
Rent of Nurses' Home.....	1,225.33	
Water.....	1,036.04	
X-Ray.....	2,874.47	
Clerks, O. P. D.....	2,621.80	
Gas and electricity.....	3,228.05	
Telephone.....	1,224.87	
Ice.....	1,657.92	
School of Nursing.....	1,953.30	
Laundry.....	671.46	
Pathology.....	988.50	
Social Service.....	1,128.03	
Sundries.....	2,365.61	
		97,867.20

Deficit.....	20,154.24	
--------------	-----------	--

	<u>\$119,875.77</u>	<u>\$119,875.77</u>
--	---------------------	---------------------

We certify that the above Income and Expenditures for the year ending December 31, 1914, is a true exhibit of the accounts and in our opinion correctly sets forth the operations for the period stated, as shown by the books.

MEDICAL DEPARTMENT

The Medical Department has now been established long enough in its quarters in the new hospital buildings to thoroughly appreciate how much it has gained by the change, and how much easier and more satisfactory it is to work in them than it was in the old building. The wards have proved most satisfactory in every way. It is hard to see how they could be improved. It would be an absolute impossibility to do in the old quarters either the kind or the amount of work which is now being done in the Medical Out-Patient Department.

The Medical Department now has forty beds in place of the twenty-five which it had during the latter part of the stay in the old building. It has thus been possible not only to take a greater number of patients, but also to keep subacute cases longer than in the past. This has been of great advantage to the children suffering from acute endocarditis after rheumatism and chorea. It has not been possible, however, to admit as many of these children as should have been admitted or to keep them as long as they should have been kept, because, if the beds are filled with these children, it is impossible to admit acute and urgent cases. That is, the number of beds, although larger than in the past, is still inadequate to meet the demand. The ward laboratory has proved itself most useful. This and the fact that a third house officer was added to the medical side last April has made it possible to do a much greater amount of laboratory work than in the past and to study the patients much more thoroughly.

The number of visits made by patients in the Medical Out-Patient Department has increased 40 per cent. during the past year. This increase is due chiefly to the better organization and to the opportunities provided by the new quarters for a larger number of physicians to work. It is due in part, however, to the new follow-up system which has been established in connection with the Social Service Department. In the old Hospital there was room for only two physicians and one house officer to work, and they were constantly in each other's way.

PLAN OF WARD

PLAN OF HOSPITAL BUILDINGS

LONGWOOD AVENUE

There were no laboratory facilities and no lecture room. In the new quarters there are a fine laboratory and a lecture room, as well as a considerable number of separate examining rooms. There are now working there every day, six and sometimes more, physicians, as well as a house officer and from five to ten student and graduate assistants. The work is so arranged that the house officer and at least one physician is on hand at 9 a. m. so that the patients who come early are not compelled to wait to be seen. At least one more physician arrives at 9.30 a. m., and the others about 10.00, when the bulk of the patients come. Every patient can now, therefore, be thoroughly examined, have all necessary laboratory tests made and be carefully treated. In fact, each patient now receives individual and personal attention. It is no wonder that the clinic has grown under these conditions. It will continue to grow, moreover, in a steadily increasing ratio as long as the physicians who are working there will continue to sacrifice themselves, their time and their private work, as they are now doing.

Much attention is now being directed in the Medical Out-Patient Department to keeping the children suffering from heart disease under constant observation. A sewing class has been established for the little girls on Saturday mornings as an inducement for them to come regularly. Especial attention is being devoted, as in the past, to the feeding of infants. This work is materially aided by the Milk Fund and its nurses. Special studies are being carried on as to the part which the gas bacillus plays in these infections. The stools of every case are also examined as a routine measure as an aid to treatment.

The reorganization of the Medical side with a single head and continuous services for everyone, which was established late in 1913, has proved most satisfactory. It has improved the character of the work done and has established an *esprit de corps* which was lacking before. A relatively smaller amount of original investigations have been carried on in the past year than was hoped would be the case, largely because of the immense amount of time and energy required to build up the clinic and get settled in the new quarters. More is under way now, however, much of which will be completed during the current year. It will be possible to undertake and carry out

more work and of a different type as soon as the laboratories are fully equipped and in running order.

The number of students, both graduate and undergraduate, coming to the Hospital has been greater than ever before. A not inconsiderable number of graduates come from long distances to the Children's Hospital to study Pediatrics under the best possible conditions. Students of this type are an inspiration to the Staff and in this way are of almost as much benefit to the Hospital as the Hospital is to them. The influence of The Children's Hospital in the community and throughout the country is immeasurably increased through the students who visit it and work in it. It is impossible to exaggerate the importance of this side of its work.

Much has been accomplished during the last year as the direct result of the removal to the new building. Much more should be accomplished in this and in ensuing years, now that everyone has become accustomed to the new surroundings and a new and better system has been established.

OPERATING BUILDING

REPORT OF THE SURGICAL DEPARTMENT

The opening of the new hospital has meant much to the surgical department. The immediate benefits have been, first, the possibility of admitting to the wards promptly children requiring hospital treatment; second, the opportunity in this way for the more careful study of cases and for the distribution of special classes of cases between the different surgeons; and, third, the increased possibilities of instructing students in the surgical diseases of children.

The tables following this report show the great variety of diseases treated and the extremely serious nature of many of them.

As in the past, many children are operated upon for the various forms of *hernia*. The inguinal is by far the most common form. It is practically invariably the result of a slight congenital fault. The chance for real cure by any other than operative means is trifling. If treated by trusses the condition may reappear at any time, often in troublesome form. The results from operation traced through a varying number of years are most gratifying. In the past year, 182 cases of inguinal hernia have been operated upon, two of them strangulated and one incarcerated. These operations permanently and surely relieve the children of what otherwise would be a more or less serious disability throughout later life.

Fifty-one patients have been operated on for *appendicitis*, an increase over the previous year of about 42 per cent. Of this number ten were cases of so-called chronic appendicitis, four were patients in whom the appendix was removed in the course of some other operation, as that for hernia or *tabes mesenterica*. Four cases had diffuse peritonitis. Twelve had abscesses of varying size; the remaining nineteen were all acute, many of them with the appendix gangrenous but operated on before it had ruptured. There was no mortality except in the cases of diffuse peritonitis. Of these one died from general septicemia and one, a patient who had a very diffuse peritonitis in about

the middle of the course of whooping cough, developed a pneumonia three days after the operation and died of this disease. The other two cases of diffuse peritonitis recovered.

Sixty-three cases of *tuberculous cervical adenitis* have been admitted to the surgical wards, an increase of about 44 per cent. over the number of last year. Of these cases, forty-one were in a condition suitable for the operation of excision of all tuberculous glands. This operation of dissection of the triangles of the neck was performed in all the suitable cases. Of these the wounds in thirty-five cases healed by first intention. Past experience shows that very few of these cases have later trouble, the results being among the most satisfactory of surgical procedures. The cases operated upon will be followed to learn accurately the end results.

In the remaining twenty-two cases, which had glands so extensively broken down that a complete excision was deemed inadvisable, the operation of incision was performed, followed by wiping out with gauze and in some cases with iodine. This operation, though not nearly so satisfactory as the total excision, has been followed by many good results, about half of the wounds healing within two or three weeks, and the patients going on to ultimate cure. Of the remainder many come back for a total excision later. It remains the policy, as it has been in recent years, to always search for the portal of entry, the commonest site of which is the tonsil. The tonsils are taken out as a routine when the glands affected are those behind the angle of the jaw. This is done at the same time as the dissection of the neck when the patient's condition warrants it, but otherwise it is done either before or after the dissection. There are a number where the tonsil operation has been performed in the throat department of this hospital or elsewhere. Of the tonsils examined pathologically about one-half show a tuberculous infection.

Where the patients' homes are in very congested districts, or otherwise unsuitable for convalescence, the patients are sent to Wellesley for three or four weeks after their operations. This has been found to be of particular advantage in this class of case, the patients returning from Wellesley almost invariably having gained weight and strength and being in a much better condition to withstand further infection. There has been no

fatality during the year. The results are very satisfactory, showing between 80 and 90 per cent. permanent cures.

The greatest surgical emergency of infancy and childhood is *intussusception*. A disease of sudden onset, coming on without warning in a healthy and active child, it becomes in a few hours a terrible abdominal emergency. During the past year ten cases have been operated upon with four deaths, one of which came on late after a secondary operation. Of the nine acute cases operated upon, three died, a mortality of 33 per cent. In the preceding three years twenty-seven cases had been operated upon with a mortality of 63 per cent. The improvement in the statistics and the hope for further improvement rests chiefly on the promptness of surgical intervention. The condition had existed for an average of 56 hours in the fatal cases; of 26 hours in those which recovered. In two of the fatal cases resection of the bowel was required. In the third fatal case an enterostomy was done.

When the diagnosis is made early, from the acute paroxysmal pain, with perhaps reflex vomiting and a slightly blood-tinged mucous diarrhea, the chances of cure by prompt intervention are good. Later when there are added the symptoms of acute intestinal obstruction with the bowel so tightly wedged into itself as to require resection, the mortality must be very great.

Stenosis of the pylorus is now regarded as a surgical disease. Early diagnosis greatly improves the chances of cure by surgical intervention. In the presence of projectile vomiting, a distended stomach with strong peristaltic contractions, and scanty stools, the diagnosis may be settled by the Röntgenologist.

Through the courtesy of the Medical Staff several cases suggestive of stenosis have been studied, and proved not to require surgical treatment. During the year seven cases have been operated upon. In all a posterior gastro-enterostomy was done. In one who died on the tenth day after operation the trouble was complicated by congenital syphilis. The other child, in extremely poor condition on entrance, died soon after the operation from shock. Some of the children who were cured were in extremely poor condition when admitted. In no case was operation evaded on account of the general condition of the patient. The Röntgenologist is of supreme aid in differentiat-

ing between cases of spasm, which by proper diet are relieved, and the cases of true stenosis, which can be relieved from death by starvation only by surgical intervention.

Seven patients with *tuberculous peritonitis* have been treated in the wards. Six have been discharged relieved, one not relieved. Most of these have been treated by the injection of nitrogen after the removal of the fluid from the peritoneal cavity. This method of treatment is being tried, and so far has yielded very satisfactory results.

Eleven patients with *stricture of the esophagus* have been treated during the year. Of these ten have been sent out improved. One has died from this most distressing trouble.

More students than ever before have in the last year received instruction in the surgical department.

It is most gratifying that the removal of the hospital to its new quarters instead of diminishing the number of patients attending the clinics has very greatly increased them, as the statistics show. The number of patients admitted to the wards has increased from 522 to 810. The number of new patients treated in the out-patient department has increased from 1,193 to 1,358. The increased facilities have furthermore rendered it possible for out-patients to be treated at any hour of the day, so that now no worthy case need ever be turned away to come at some stated hour.

In every way the opportunities for service to the community have been increased far beyond any statistical measure.

LEGEND: WARD PAVILIONS, SHOWING CONNECTING CORRIDORS, AND REAR OF ADMINISTRATION BUILDING

ORTHOPEDIC DEPARTMENT

The past year in all departments of the hospital has been one of reorganization to meet the new conditions, and it is hard to draw any definite conclusions from data presented. The move to the new hospital was only made in April, and an entire reorganization of all departments has been necessary. The change has been of the greatest possible benefit to the orthopedic as to the other departments, and the work is now done for the first time under satisfactory conditions, conditions which could hardly be improved upon.

The construction of the wards is particularly favorable for the treatment of orthopedic cases, because with the large number of cases of tuberculous joint disease that we necessarily have, the present conditions make it possible for us to treat the children by out-of-door treatment, with an apparently marked improvement over previous conditions. The danger of hospitalism seems much less, and we find that the children bear bed confinement much better than under the old conditions. The segregation of the children in ward units of ten has also apparently affected favorably the occurrence of infectious disease because whereas in the old hospital the orthopedic department was seriously handicapped—as a rule several times a year—by the presence of infection spreading among the children, in the months since we have been under the new conditions we have had no trouble from such conditions. No child in any unit is allowed to see a child in any other, and if a contagious disease breaks out we are in a position to isolate the ward and continue the rest of the service. Formerly, with the children in the large wards, the service was greatly crippled, as happened for several weeks during the latter part of our stay in the old hospital.

A step in the way of advance has been made by the separation of the orthopedic and general surgical services, as far as house officers are concerned. Formerly house officers served on both, and under the new conditions it was found impracticable to go on with this.⁶ Now separate house officers give their entire time, one set to the orthopedic service and the other set to the general surgical service. In this way greater concentration of work has been accomplished. One notable effect of this has been the improvement in the observation and record

of the patients. In a teaching hospital an adequate and scientific system of records is necessary, and it has been found that the constant presence of students in the wards has proved not only a stimulus to the house officers in bringing the records up to a modern scientific standard, but is a great benefit to the students, because now an approved record is considered sufficient for the student to study, and gives him a complete résumé of the symptoms and the physical examination of each case.

More instruction is given at the hospital than formerly, and two student assistants are now assigned every month by the school to serve as assistants in the orthopedic service. They have proved of use, and apparently feel that they derive a good deal of benefit from the opportunity to observe a case from the time of its admission, through operation, and up to the end of treatment.

The close association of the orthopedic department with the scientific departments of the school has been of the greatest benefit, and the clinical observation of cases, with the facilities now at our disposal, bears no comparison whatever to our condition of a year ago. With our laboratory visiting staff we are in a position to obtain immediately information and assistance from experts in any difficult problem that arises in the service.

We had anticipated that the move to the new hospital would be attended by a distinct falling off in our clientele in all parts of the hospital, but this has not proved to be the case. The new conditions have led to one modification of the routine in the orthopedic out-patient department. It seemed unfair that patients who came from a distance should be turned away from the hospital because they came out of hours, and an arrangement has been made by which out-patients applying for orthopedic treatment are seen whenever they come, registered as patients, and after being instructed what to do temporarily are told to return to one of the regular clinics, which are held in the afternoon. This has worked satisfactorily, and has been a convenience to many out-of-town patients.

It seems probable that working under the new conditions the orthopedic department will become much more productive scientifically than it has been in the past, on account of the ad-

mirable facilities under which we work. At present practically every member of the visiting staff and each of the house officers in the orthopedic department has on hand some piece of research work, and it is fair to assume that some of them will reach a point where something may be contributed to the progress of our knowledge.

Especial attention is being paid to the treatment of lateral curvature of the spine, which is at present one of the most discussed subjects, with an attempt to see what results are really being obtained by means of corrective plaster jackets. There is an absence of definite data as to just what is accomplished by these jackets in the way of permanent change to the bones of the spine, and many opinions have been expressed one way and another. Few institutions are in a position to settle down to a serious study of just what can be accomplished, but this, with the assistance of our admirable X-ray department, is now possible. This investigation is being carried on by three observers working on independent lines. Attempts are also being made to find out what the final results show in the treatment of club-foot and the treatment of infantile paralysis by operation, and other investigations are being conducted into the pathology and especially the X-ray appearances of certain obscure diseases of bone akin to rickets, and often confused with it.

One great need in The Children's Hospital has been fulfilled by the generosity of the Managers in providing an expert who gives her whole time to the giving of massage and exercises in the wards of the hospital to such children as need it, and who has in the afternoon supervision of the clinic for lateral curvature. This makes it possible for us now to keep in the wards cases of infantile paralysis and chronic joint disease, which we have never been able to do before, and the addition to the service has proved of the greatest practical benefit to the patients. This step is somewhat in advance of the course pursued by most hospitals, and is demonstrating that it should be an integral part of a children's hospital. Although we share the services of this assistant with the medical and general surgical departments, the orthopedic department by the nature of things makes more demand on her time and is more in need of her services.

The conjoined clinic of the orthopedic and neurological departments for the treatment of infantile paralysis is discussed in another place, but it has grown very much and is of very great value in providing for poor people a treatment by muscle training which they would find it hard to obtain under other conditions. Probably no part of the hospital is of greater use to the community than this.

The lateral curvature department, which is under the supervision of the orthopedic department, is discussed in another place, and is one of the active parts of the orthopedic service.

The Convalescent Home is of more use than it has ever been, with our increased number of beds, and is visited by the resident surgeon twice a week. Cases are sent there as soon as possible after operation, as they convalesce more satisfactorily at the Home than they do in any hospital in a city, and it is, as it always has been, of the greatest value in maintaining the efficiency of the hospital.

The courses open to graduates have been taken by many men from all parts of the country, and there is practically never a time when graduate students are not in attendance in the orthopedic department. Undergraduate instruction is given every morning to the two assistants already spoken of, who come to the hospital for a month, and another course is being given in the afternoon in alternate months, which is largely attended. This course is given three or four afternoons a week at The Children's Hospital, the other afternoons exercises being held at the Massachusetts General Hospital.

The hospital has again given a course of lectures to the Boston school nurses, and it is felt that in this way the hospital is of service to the community, as it gives plain practical demonstrations to women who are constantly in touch with the poor children of Boston, enabling them to know which cases are seriously in need of attention.

Doctor Fitzsimmons, who finished his two years of residency in September, was appointed junior assistant surgeon to the hospital, and Dr. Frank R. Ober took his place as resident surgeon. The work of the residents and of the house officers has been of the highest grade, and any increased efficiency of the service is largely dependent on their untiring efforts.

DEPARTMENT OF PHYSICAL THERAPEUTICS

A branch of work which starts its activity with the new hospital is that of Physical Therapeutics. Never before has there been a resident person in charge of this branch of work. It is now the intention to have such treatment available to all cases in the wards that are in need of exercise, muscle training and massage. It has been possible by the establishing of such a position to have a trained person in charge, who has under her care all cases that are referred for such treatment from any service. The department has been in operation since July 1, 1914, and in that time there have been under treatment forty cases, and seven hundred and ninety-six treatments have been given. The demand for such service has been greater than could be adequately handled by one person, and it has been found necessary to take on an assistant, whose work is under the constant supervision of the one in charge.

Cases of infantile paralysis are especially benefited by constant and regular treatment. Each case upon admission is carefully examined by the one in charge of the physical therapeutics with reference to ascertaining the individual muscles that are paralyzed. This is recorded in the form of a muscle chart which is filed with the house record, and a new one is made at intervals showing progressive improvement under treatment. Owing to the recent and devastating epidemics of this affection many cases have been brought to the hospital for treatment, and it has been necessary to devote much time to the details of the muscle paralysis always present, which affects balance and coördination; the work of this department has been to further the progress of these cases by careful application of muscle training which helps if possible to restore such a loss. The treatment is pursued both before and after operation, and has been found to assist vastly in the end result.

Cerebral paralysis is very noticeably benefited by work directed toward coördination, and it has been the good fortune of the department to accomplish results that have made an operation unnecessary in some cases.

Cases of resistant club feet have been forcibly stretched and on some occasions, in combination with plaster casts, operation has not been thought necessary; in other cases preliminary stretching merely assists the final operative manipulation.

Assistance is also given to those cases that have been long in plaster. Cases of congenital dislocation of the hip after coming out of their corrective cast are manipulated and massaged and finally brought down to the normal position in comparatively short time—such cases often have two treatments a day.

Cases of chronic heart disease in which the circulation and general condition are poor are treated with “baking” by means of an electric heater made available for every bed, and massage. These cases have been considerably benefited under such regular care. Cases of post-diphtheritic paralysis, rheumatic fever after the acute stage, anemia and chorea have been treated and have shown improvement. From the general surgical service demands have been light owing to the fact that the cases are usually discharged as soon as any treatment other than purely surgical is possible, though several cases of burns have been helped by loosening the cicatricial tissue with massage.

The work has not been established long enough to make numerical statistics of any great value, but it has made apparent, judging from the constantly increasing demand, its value not only in adding to the efficiency of the hospital treatment but also in hastening the convalescence of the patients so that they may the sooner leave the hospital.

SCOLIOSIS CLINIC

As with all other departments the scoliosis clinic has been much benefited by the removal to the new hospital. The work has been set forward by larger and more adequate surroundings, and the opportunity has at no time been so great for the careful study of this much discussed subject.

The treatment of suitable cases by gymnastic exercises still continues as part of the regular work of the clinic. There has been an increase in the number of student workers who still come to the hospital from the senior class of the Sargent Normal School of Physical Education in Cambridge. There is also a special exercise class for cases of faulty posture, which meets on clinic days after the regular clinic. It is possible to reach and benefit a great number of the slighter postural deformities and to do a large amount of preventive work.

There has been a great amount of time devoted to the treatment of structural scoliosis by forcible correction in plaster. The surgeon in charge has given much time not only to the supervision of the work but to the actual application of the jackets and the results so far have been most gratifying. Every case is X-rayed at the beginning of treatment and later at intervals to ascertain whether the correction is progressing satisfactorily. It has been thought expedient in the interest of the service to amalgamate the House and the Out-Patient Department in order to keep the cases under closer observation.

Besides the therapeutic work of the clinic there is the teaching side which makes the fact of our being able to take care of a greater number of cases an advantage in that we are able to have a larger supply to draw the teaching material from.

STATISTICS FOR 1913-1914

Number of permanent plaster jackets.....	79
Number of removable plaster jackets.....	38
Number of exercise cases.....	160
Number of new cases.....	100
Total attendance and number of visits.....	4724

It is evident that the work of the clinic has progressed this year and that we owe much to the enlarged proportions of the new hospital which make it more possible to conduct an efficient department.

NEUROLOGICAL DEPARTMENT

The moving of the hospital to the new buildings, which occurred the first of April for the Out-Patient Departments, has for the first time in its history given the neurological department quarters which were adequate for carrying on the work. This has resulted in the Staff being able to handle the cases coming to the clinic with much less delay than heretofore; the greater number of examining rooms has prevented one case that has been seen delaying other cases, and has also enabled the physicians to avail themselves of the help of more assistants. The increased amount of room has allowed us to use the material of the clinic with much more ease for teaching, which is one of the most important functions of a hospital, and this can now be carried on without delaying the ordinary work of the clinic, as was inevitable in the old hospital building.

The teaching in this clinic has assumed more importance than ever before in the history of the department. Not only have large classes of graduates been given clinical exercises in the summer as has been the case for a number of years, but these exercises have been given throughout the summer instead of during only a part of it as heretofore, and in addition graduates in medicine have been taught nearly continuously throughout the year. The importance of this instruction in the nervous diseases of children can be appreciated better when one knows that in no other hospital in this country does there exist a clinic devoted entirely to the treatment of the nervous diseases of children. The length of time during which this department has been established, now about twenty-five years, and the courtesy of the other members of the staff in freely referring cases of nervous disease, as well as many cases of doubtful diagnosis for the exclusion of nervous disease, and cases for special examination where electrical or other tests would aid in establishing the diagnosis, has resulted in building up a clinic which is of the greatest variety and interest, both for purposes of study and for teaching differential diagnosis.

The establishment of the clinic for the treatment of paralytic cases by massage, muscle-training and other methods, now

under the joint management of the orthopedic and the neurological departments, has resulted in various advantages to the hospital which are best spoken of in this report. It has benefitted the neurological department also directly by enabling it to provide the treatment desired for a greater number of our cases, and also in making a greater variety of cases more readily available for the teaching purposes of the department. The whole department however regrets most deeply the retirement of the former director of this work, whose whole-hearted devotion to it for many years was not only of the greatest benefit to the patients, but led to the development of methods of treatment of the cases which are widely acknowledged to be of the very greatest importance, so that our new department for the treatment of the paralyzed cases, the outgrowth of this work, has no equal anywhere in results obtained.

The modern electrical apparatus, and other new instruments which have been installed in the new hospital have been of great use to the neurological department in its work.

The loyal spirit of coöperation of all the physicians in the department, and not less that of other workers in it, has rendered the work not only easier, but has made it pleasant, in spite of the fact that because of lack of enough assistants for the amount of work to be done, all have had to work longer hours than should be the case.

SPECIAL CLINIC FOR THE TREATMENT OF PARALYTIC CASES

The results of massage and muscle-training in this clinic for all kinds of paralysed children during the year 1914 have been most satisfactory. The new hospital with its large and well-arranged treatment rooms has added greatly to the facility for handling a large number of cases. New apparatus, electrical and otherwise, and plenty of space gives us greater opportunity for better work. Through the generosity of those who gave to our special fund for the payment of operators, we have been able to have an increase of about eight trained operators. This addition to our force has made it possible to more than double the number of treatments given over the previous year (6,088-2,550). In order to continue treating this number of patients we must have further specially designated contributions for the payment of operators, as this clinic is supported entirely separately from the general hospital fund.

The progress of each case is marked on a diagram. These diagrams or myographic charts show each muscle. By a system of marking the paralysed muscles on these charts, the changes occurring in the muscles are recorded at definite intervals. Special records of each case with measurements taken at stated intervals to correspond with the muscle charts are kept in the clinic. These are supplemented in many cases by a series of photographs. A study of the conditions of the shoulder joint in obstetrical paralysis by means of X-ray and clinical observations has been begun. The cases of obstetrical paralysis are being treated largely by the methods of muscle training and massage perfected by Miss Colby during her experience of many years at this hospital.

Infantile paralysis has been treated chiefly by both massage and muscle-training, that is, muscle education. In many cases where the patients were unable either to walk or stand on coming to the department, they now walk, not only by the means of such apparatus as may be indicated, but also on account of the regeneration and reëducation of the affected muscles. Many

WARD SOLARIUM

cases have not required apparatus at all, and some have been able to discard apparatus which was formerly necessary.

Cases of spastic paralysis, in addition to muscle-training and massage, have been given special coördination exercises, for which the new hospital has provided us with a suitable amount of gymnastic apparatus. Corrective exercises for such conditions as torticollis and the motor tics are also given in this clinic.

In the resignation of our former Director, Miss Jennie M. Colby, we have suffered a great loss. Miss Colby has given unstintedly loving and devoted service for over twenty years and it is with deep regret that we are forced to accept her resignation.

REPORT OF THE THROAT DEPARTMENT

It is impossible for the members of the Throat Department to review the work of the past year without first expressing their satisfaction in the greatly improved facilities afforded by the new equipment and organization in the new building. These may be summarized as follows:

(1) The segregation of this unit of the hospital into its own separate and conveniently located rooms for examination, operation and ward treatment.

(2) The appointment of a graduate nurse in charge of this department alone. We have been particularly fortunate in securing for this appointment an efficient and faithful nurse who has been of the utmost assistance in the care of patients, not only in all matters pertaining to operations, but also in the general management of the clinic.

(3) The establishment of a ward under our own control. The results of this improvement in our facilities are shown in the increased number of patients whom we care for, the better care of patients after operation, and the opportunity to manage the treatment of certain important classes of cases which require careful supervision in the ward for longer periods of time.

All cases operated upon for tonsils and adenoids are now kept in the hospital for at least twenty-four hours after operation. The enforcement of this rule has in itself shown its value. A considerable number of these cases have had delayed primary hemorrhage which became apparent two or three hours after operation. Their retention in the ward has enabled us to furnish prompt and efficient relief in every instance of this dangerous complication.

A considerable number of these cases have also shown evidence of acidosis following operation, a condition which we have been able to control at an early stage by prompt treatment. In addition to these, other complications have arisen, which have proved the value of our present system of ward supervision of these cases for at least twenty-four hours after operations.

While the bulk of our work is as heretofore concerned with tonsil and adenoid cases, we are now enabled to take care of other cases in our own ward which require treatment of longer duration. These include cases of chronic stricture of the larynx, stricture of the esophagus, papilloma of the larynx and foreign bodies in the esophagus, larynx, trachea and bronchi. Among these last was the case of a girl of eight years, who had carried an open safety pin in the left primary bronchus for six years. The removal of this foreign body by bronchoscopy, resulted in the cure of a distressing purulent bronchitis which had been present since the inhalation of the pin.

We have now under treatment in the ward a case of chronic stricture of the larynx following diphtheria, who has been compelled to wear a tracheal tube on account of almost complete closure of the lumen of the larynx. This lumen is now being gradually enlarged by a series of intubation tubes especially constructed by Doctor Lynch of New York, to dilate the stricture at its narrowest point. The case is making good progress, but the process is slow and necessitates a prolonged stay at the hospital. It is in dealing with such cases as these that the advantages of our present quarters and equipment are most appreciated.

REPORT OF LABORATORY STAFF

The relation of the Hospital to the Laboratory Departments of the Medical School has become closer and more defined during the past year. The Hospital is unique in that the heads of a number of the Laboratory Departments of the School have been appointed to the visiting staff on the same footing as the clinical members. The idea underlying such an arrangement is, of course, to bring the two branches of activity into a closer relationship than has heretofore been possible, and on a basis of equality. Each Laboratory Department will have the direction of so much of the routine work of the Hospital as falls within its fields. It will have referred to it such problems of general management or special investigation as arise. It will also, it is hoped, of itself discover lines of work to be undertaken in the course of which problems may be solved of value to the patients. By the arrangement here described the fields of physiology, chemistry, pharmacology, pathology and bacteriology are covered in a broad way, but the arrangement has only covered a part of one year, so that its full benefits are not yet apparent.

However, from the Department of Physiology comes the stimulation of a series of investigations on "Sensitiveness in Infantile Paralysis." These have been begun by Assistant Professor Martin with apparatus especially devised by him and with the sympathetic interest of Professor Cannon.

The chemical laboratory of the Hospital has been fairly well equipped for metabolism investigations except for one indispensable instrument (the calorimeter) which we have failed to obtain on account of the war. Aside from minor work, such as helping with ordinary clinical tests, improving the method of handling the alcohol used for sterilizing purposes so as to prevent waste, we have made a number of acetone determinations, but no really serious case of acetonuria has yet developed since the Hospital was moved to its present quarters. We had hoped to take up the study of rachitis, but after three months of continuous work on the technic to be used, we are still struggling with aspects of the problem and it will probably require considerable more time before it will be worth while to apply the technic to urine. This work is being done in the Chemical Laboratory of the Harvard Medical School by Dr. Henry Lyman.

There has not yet appeared a special line of effort to arouse the pharmacological interest, but the knowledge of that Department has been frequently of value in Staff discussions.

With the resignation of Dr. Howard T. Karsner a new appointment has been that of Professor S. B. Wolbach as Visiting Pathologist. For this reason the work in this direction has not been as continuous as will be the case in the future.

The routine bacteriological work began in May. From the fifth of that month to January first, 1915, two hundred and six examinations were made for diagnostic purposes, of which a summary follows.

For the gonococcus	45
Abscesses, non-tubercular (boils, cellulitis, appendix)	37
For diphtheria bacillus	36
Typhoid agglutination tests	19
Presence of tubercle bacillus (animal inoculations 5)	13
Osteomyelitis	13
Chest (empyema)	10
Infectious diarrhea	7
Of the nose and throat (non diphtheritic)	5
Spinal fluid	5
Pneumococcus	4
Urine	4
Teeth	2
Tetanus	1
Unknown	1
Worthless specimens	3

In addition to this the problem of the control of vulvo-vaginitis was proposed for solution and a set of rules was formulated and put into force, which seems to have been successful in controlling the infection. A course of lectures to the nurses of the Training School has been arranged to be given by members of the Department. Special researches are proposed of which it is too early to speak.

The good influence of this close alliance between the clinical and laboratory departments is further shown by the series of clinics that have been arranged for the winter. These take up special topics, are held once a month, and have thus far proved interesting and profitable to large audiences.

REPORT OF THE RÖNTGEN DEPARTMENT

The increasing importance of the position which this Department has taken in the activities of the Hospital has suggested the advisability of a thorough reorganization of its routine mechanism. The function of this Department is expanding from that of an important diagnostic accessory to that of a distinct instrument in scientific research. In order that this function may have full room for expansion and growth, it has been decided to elevate the Röntgen Department to a position in which it may serve equally with the other departments of the institution. By such reorganization as this, Röntgenology joins the ranks of the forces which make the clinical laboratory of such value to modern medical and surgical procedure. A Röntgenological laboratory, so classified, must at once disassociate itself from that which is a technical art only. The photographic work of the Hospital, therefore, has been reorganized as a department separate from the Röntgen Department with which it has previously been connected.

The Röntgen Department enters upon a new year in the pursuance of its fullest function—as an instrument of research. Its assistance has already been employed in an especial investigation in rachitis and also in bone syphilis.

A report at the end of another year will, it is hoped, record the activities of this Department in a sphere of much greater diameter.

REPORT OF THE CHARITABLE SURGICAL APPLIANCE SHOP FOR 1914

In April 1914, the Charitable Surgical Appliance Shop moved into new quarters in the new Children's Hospital building.

While we are not provided with any more actual floor space than in the old building, the space is much more systematically sub-divided, also the light and ventilation and facilities for keeping the shop clean and neat are far better than in the old hospital building, and in every way ought to make possible better work being done by the men employed. The number of employees remain the same—five skilled, highly paid men, one apprentice, one office boy and a woman bookkeeper.

The shop has been provided with a number of new machines, run by separate motors, and these together with the old machines that have been moved over, provide us with facilities for turning out any kind of appliances that the hospitals or doctors require, and we believe we are in a position to make them at less expense than formerly.

Owing to the times the amount of work so far has not increased over what was done in the old shop, but during the past year we have received work from about twenty-five different hospitals and institutions, and between seventy-five and one hundred doctors. Some of the institutions for whom we do work are located as far away as Mississippi, Louisiana, Oregon and Nebraska.

Total receipts for the year from doctors and individuals.	\$6,465.21
Total receipts for the year from hospitals and institutions.	\$4,372.42

SOCIAL SERVICE DEPARTMENT

The Social Service Department reports a year of active and successful work. Nine hundred and thirty-six new cases have been referred to this department through the year, from the Hospital proper, the Out-Patient Department, other institutions and outside agencies. These added to the number remaining at the last report make a total of two thousand, four hundred and thirty-six families with whom, according to their necessities, we have kept more or less closely in touch during the year.

The scope of the work is ever widening and pressing for development along new lines. In the autumn a class was formed for the heart cases. This consists of girls between nine and fifteen years of age, who have been under the care of the Hospital for some chronic heart lesion. These fifteen girls have spent two summers at the Camp for Hearts at South Duxbury and are now in fairly good condition. They gained in health and improved greatly during their stay of two months. It is hoped that in the future it will be made possible for the camp to extend its season to four months, June to October. To these children the outing is of the utmost importance and on their return home we keep in touch with them through the follow-up work. The purpose of the class, which meets at the Hospital every Saturday morning, is to keep the children under observation and give them training in such work as requires a minimum of physical exertion. This class is under the direct supervision of a volunteer worker to whom our thanks are due for the interest and enthusiasm with which she has inspired the children. Regular visits are also made to the homes of these children. Some of them cannot attend school regularly, nor engage in active sport.

The demand for special instruction in the home cases of closely confined children has led to individual instruction in the manual arts and grade work. For instance, one girl of eleven years, a deaf mute, crippled by paralysis, has learned basketry and is now able to occupy herself happily. In the North End, a few steps beyond Paul Revere's dwelling, one has to look twice for an alley leading to a ground floor tenement of two rooms where lives one of our cases, a boy with serious heart trouble, mentally keen, yet excluded from school and play by

his physical condition. Through the coöperation of the teacher with a volunteer worker who now visits the home weekly for the purpose of instruction, he has been supplied with a complete set of fourth-grade books. The two-hour weekly lesson is producing good results; for the boy, conscious of his progress, applies himself earnestly and considers himself more nearly the equal of his fellows.

We are deeply indebted to the three volunteer workers who offered their services to this department in response to its growing needs.

The demands which have to be met are many and varied. In addition to the many visits made to the Social Service office at the Hospital, six hundred and ninety letters of inquiry and appeal have been received and eight hundred and two letters in reply and further investigation have been written during the year. Two thousand, nine hundred and ten visits have been made by the social service worker and her assistants to the houses of patients. Two pupil nurses of the third-year class usually assist in this department, each as a rule having two months duty as junior and two months duty as senior assistant. The junior visits all surgical cases, the senior visits all orthopedic and medical cases, does all surgical dressings and instructs the mother in the care and application of apparatus and insures the proper carrying out of all treatment ordered by the surgeon. Nine hundred and six new cases, of which five hundred and eighty-two are strictly social service cases, have been added to this list during the year.

By means of accurate records kept in the out-patient department of all cases under treatment, it is possible to keep in close touch with any patients who fail to report as requested. The houses are visited with universally satisfactory results, the personal influence and desire for helpfulness manifested, insuring from the parents a ready compliance with all requirements. Interest and confidence in this Hospital are very widespread and frequently expressed. On a Malden car, the conductor helped so kindly and quickly, when a little girl suddenly became car-sick, that the volunteer assistant on inquiry as to her own destination, ventured the information that she was on an errand for The Children's Hospital. The conductor said:

"Oh, I know several children who have been there and they

are all well now. A very fine hospital, and they are so kind there. Some friends of mine took their child in for an operation on adenoids. They went in the wrong day but they had come from such a distance that the Hospital sent out for a specialist to come in and operate. My friends were greatly impressed."

In many instances where children have failed to report, investigation brings to light existing home conditions which bar the possibility of the called for expenditure on braces and splints prescribed.

The Christmas season brought its own offering of good will and kindly effort. One special donation of twenty-five dollars was expended by the social-service worker for warm underclothing and four baskets of provisions. These were distributed to needy families, contributing greatly to their comfort and happiness. On the Saturday before Christmas the Heart Class celebrated with a party full of the holiday spirit; furthermore, as an expression of the interest felt by the volunteer workers the Social Service Department was this year given a Christmas tree and sufficient gifts for all out-patients who attended the clinics on December twenty-third.

Children were largely represented in the donations which were so liberally contributed, a double end being achieved, since the need of those who gave as well as those who received was thus happily satisfied.

We who are closely associated with the Service, feel that as with the children in this special Christmas instance so with all fathers and mothers of families more fortunate than those who come to us, it needs but the simple statement of truths revealed through the work, to open the way to greater comprehension and sympathy and a heartier coöperation in the opportunities of medical social service as typified in the success of the past and the promise of the future.

Social Service Staff consists of:

Miss Isabel M. Tessier.

Second and third-year pupils of Nursing School.

One sister of Saint Margaret.

VOLUNTEER WORKERS

Mrs. George F. Hatch.

Mrs. John Broadhead.

Miss Dorothy Harding.

REPORT OF THE SCHOOL OF NURSING

The School of Nursing of The Children's Hospital, Boston, was one of the principal objects embraced in the original scheme of the work, but its formal organization was not established until 1891. Since that date the history of the School has been characterized by a steady growth, and each year has shown an advance along educational lines. The past year has been one of transition and of preparation for future development. The curriculum has been revised and more carefully graded, several new courses of lectures have been added for the second- and third-year pupils, and regular daily practical demonstrations in nursing classes have been instituted for the probationers.

The move into the new hospital in April necessitated the enlargement of the school not only to man the wards—with double the number of beds—and to allow for larger classes at Simmons College, but to provide for all affiliations with other hospitals. The Nurses' Home adjoins the Hospital on Longwood Avenue, and is a five-story building with rooms for sixty nurses, some double, but mostly single-bed rooms, of good size and comfortably furnished. In addition to the two general reception rooms, there are sitting rooms on several of the floors, and a class room on the ground floor conveniently situated for the routine class work, where lectures are given to small bodies of students. Another room in the basement, of similar size, has been fitted up with beds, etc., for the practical classes.

A large serving room equipped with all conveniences, opening into the dining room, solves one of the problems of a Nurses' Home and makes possible the serving of hot meals. By means of an automatic elevator the roof garden is reached, where a comfortable out-of-door sitting room and sleeping porch is provided. The tennis court, a gift of one of the Managers, affords opportunity for pleasure and exercise which has been much appreciated.

The course of instruction offered pupils covers a period of three years and includes the Theory of the Practice of Nursing both of children and adults. The school is registered with the Board of Regents of New York State and graduates are eligible

for membership in both the Massachusetts State and the National Association of Nursing.

The preliminary course is six months, the first two months of which are spent partly on the wards and partly in the class room, where practical classes are held daily. The pupils are thus allowed to prove their fitness for the work before passing on to the second stage, the academic work at Simmons College, the examinations on which they are required to pass before they are formally accepted as pupil nurses. During the next two years they are given experience in the wards of the Children's Hospital, in the orthopedic, medical and surgical cases, in the Out-Patient Department, the operating rooms, and the Throat Department, and as visiting nurse in the Social Service Department.

At the beginning of the third year the pupils are sent to the Massachusetts General Hospital for four months and the following elective courses are open to those desiring them.

A course in anesthesia; three months at Corey Hill Hospital for private patients; six months at the Boston Lying-In Hospital; and during the past year there has been added a short course with the Instructive District Nursing Association.

Through the courtesy of the Dean of the Harvard Medical School, the graduating exercises of the class of 1914, were held in the amphitheatre of one of their buildings, thus emphasizing the close connection with the Medical School and the surrounding group of hospitals which form so important a centre of teaching in the eyes of the medical world, and cannot but greatly benefit the School of Nursing. Fourteen nurses received the diploma of the School on this occasion.

Our thanks are due at all times to the medical staff for their interest and support, as well as their care of the nurses in cases of illness. And it is but just at this time to say a word of appreciation of the fine spirit of loyalty and devotion to duty which has been displayed by both graduates and pupils, without which much of the work of the past year would have been impossible of accomplishment.

NURSES' ALUMNAE ASSOCIATION.

For the past fifteen years the Alumnae Association has held monthly meetings at the Hospital through the winter. Recently it has held weekly meetings to make up hospital supplies for the countries now at war. For this purpose it has appropriated \$100.00 from the relief fund, and the members have worked with a hearty good will to make the money go as far as possible to help those whose need is so urgent at this time. An additional fund of \$35.00 will be spent for anesthetics to be forwarded with the dressings and bandages now being made.

At the regular meetings the association has enjoyed the presence of guests who have spoken upon subjects of medical and social interest. It is hoped that this may become an established precedent, as such lectures are one of the means by which the older graduates are enabled to keep in touch with the advances in medical and surgical knowledge.

A Nurses' Relief Fund has been started, and though at present small, it is growing steadily. Half of the yearly dues are added to it, and in time we trust the fund may be large enough to be available in case of need.

VOLUNTEER WORKERS

The following volunteer workers have made frequent visits to the Hospital and Out-patient Department during the winter:

Mrs. Felton B. Elkins	Miss Annie Lamb
Mrs. Wm. E. Ladd	Miss Edith Litzinger
Mrs. Joseph Lovering	Miss Susan Parsons
Mrs. Chas. G. Mixter	Miss Lucile Pierce
Miss Agnes Barrett	Miss Virginia Pierce
Miss Sabre Batchelder	Miss Miriam Sears
Miss Kathleen Cobb	Miss Elizabeth Silsbee
Miss Louise Converse	Miss Ray Slater
Miss Frances Curtis	Miss Adele Thayer
Miss Douglass	Miss Margaret Thayer
Miss Faith Ellis	Miss Alice Thorndike
Miss Madeline Harding	Miss Priscilla Thorpe
Miss Dorothy Hurd	Miss Elizabeth Ward
Miss Dorothy Jackson	Miss Dorothy Whipple

MEMORIAL BEDS

By a vote of the Corporation.—Any person giving to the Corporation, at one time, not less than one thousand dollars, has the privilege of affixing a name to a bed in the Hospital, subject to the decision of the Managers in each case. This permission, however, does not carry with it any right or control over the bed named.

Memorial beds bearing the following names have been established:

SULLIVAN AMORY.	ALICE M. C. MATTHEWS.
ABIGAIL P. BANCHOR.	JAMES C. MELVIN, JR.
MARTHA HIGGINSON BARBOUR.	KENT PETTINGILL.
SARA P. L. BLAKE.	ELLEN MARIA PIERCE.
CHARLES ALFRED CHAPMAN.	THERESA PIERCE.
MARIA FRANCES COPPENHAGEN.	MARY ELLEN PUTNAM.
SARAH WINTER COPPENHAGEN.	DOROTHY QUINCY.
FLORENCE DEAN CURTIS.	FRANCIS SKINNER.
CHARLES DALTON.	ELLEN RICHARDS SLATER.
CHARLES DICKENS.	RACHEL TOWER TARBELL.
CHILDREN OF MRS. ELIZA JAMES	ALICE F. TAYLOR.
(BELL) DRAPER.	SARAH ELIZA THACHER.
JESSIE PRESTON DRAPER.	LOUISE JULIA TUCKER.
SELINA HUNTINGTON JARVIE	LIVINGSTON WADSWORTH.
FLETCHER.	STEPHEN WHEATLAND.
ROSAMOND FREEMAN.	SARAH WYMAN WHITMAN (two).
WILLIAM GRAY.	JAMES HENRY WILLIAMS.
GEORGE F. KIMBALL.	ROBERT PEARCE WILLIAMS.
EDWARD ELLERY KNOWLTON.	DOROTHY WINTHROP.
RUTH E. MARTIN.	HARRIET ELIZABETH PIERCE WOOD.

In addition, the sun rooms bear on bronze tablets the name of HOPE CLEMENT; a memorial window in the girls' Surgical Ward, established in 1886, that of SARAH KITTRIDGE GOODNOW; and a small library, that of MARIAN BURNHAM.

Thanksgiving and Christmas dinner for all in the Hospital.
 Christmas trees and toys for all the Wards.

THE CONVALESCENT HOME
OF
THE CHILDREN'S HOSPITAL
WELLESLEY HILLS

THE Managers of the Convalescent Home of The Children's Hospital present to the public their Thirtieth Annual Report, having been incorporated under their present name in 1884; but the Institution, which was originally known as The Ladies' Aid Association, began its actual existence forty-five years ago, the year of the Incorporation of The Children's Hospital, with Mrs. Robert C. Winthrop as president; Mrs. William Tucker, vice-president; Miss M. L. Robbins, treasurer, and Mrs. J. C. Hooker, secretary.

Five years later, in 1874, the first Home was opened in a small hired house, and I quote the following from an old report written by the Rev. Chandler Robbins.

"The Ladies' Aid Association has had an important part in promoting the success of the Hospital, and has added largely to its resources and accommodations. Besides neatly and tastefully furnishing the rooms, providing articles of clothing and use for the children, and many little comforts and means of amusement, and cheering and encouraging both the nurses and patients by personal visits, it has provided and fitted up a Convalescent Home, in the pleasant village of Wellesley, about fourteen miles from Boston. In a sanitary point of view, the value of this gift cannot be estimated too highly. During the past summer and autumn, fifteen patients at a time have been here provided for. The influence of the pure country air has been beneficial in every case, having a favorable effect even in cases beyond recovery. But even if its remedial power were less than it actually is, the delight which the children feel—

many of whom have never been beyond the narrow and gloomy courts and alleys of the city—at finding themselves in the open air, in the broad and sweet fields, amidst flowers and birds, and the pleasant sights and sounds of the country, would be an ample return for all that the Home has done.”

The first Home was built in 1892 on land presented by Mr. H. H. Hunnewell, with accommodations for forty children, but this building was destroyed by fire in 1903. During the next two years the patients were housed in temporary quarters, hired in Wellesley Hills, and the Shack System which has proved so beneficial was inaugurated. In 1905 the present building was completed on the site of the former one, with accommodations for ninety patients. The beds are equally divided between the surgical and medical cases, and ten beds are usually kept vacant in order to be ready for emergencies. The cases treated range from those just recovering from acute attacks of illness or serious operations, to those suffering from long and exhausting diseases, whose care depends upon months of careful nursing and attention.

The doctors devote much more of their time now than they formerly did to the Home, making, between them, on an average three visits a week. The patients are sent to the Home from the Hospital regularly once a week in a special electric car, in charge of a doctor and trained nurse, and the barge from the Home meets them in Wellesley Hills and conveys them to their destination. A nominal charge is made for the care of each patient, but no case is refused if the parent or guardian is unable to pay.

The work at the Home has progressed favorably throughout the year, Miss Davidson being in charge and filling her double post of head nurse and housekeeper with the greatest intelligence and interest. Miss Rowan, the kindergarten teacher, after several years of faithful and successful instruction, has left, and her place as yet has not been satisfactorily filled. The kindergarten department is now considered a most important factor in the care of the patients; lessons are given five times a week and the beneficial results are very apparent.

The working staff of the Institution consists of eight domestic servants, twelve ward maids, three trained nurses and three

men about the house and grounds, and slowly but surely the daily expenses mount higher and higher, necessitating a constant drain on the principal.

The managers wish to express their appreciation of the unwearied kindness and devotion of the Sisters of St. Margaret who, beside the great work which they accomplish at the Hospital, also exercise a general superintendence at the Home.

Cases of contagion have broken out several times at the Home, necessitating a period of quarantine which unfortunately lessens the number of children sent out from the Hospital. One of these cases occurring at Christmas time prevented the Managers from having their annual Christmas tree to their great disappointment; they sent all their customary gifts, however, of books, toys, candy, etc., which were distributed by Miss Davidson and her assistants. The large tree always hitherto given in the Hospital has had to be abandoned as there is no one large ward in the new building where the children can be assembled, but in each of the twelve small wards or shacks, a little tree was given on Christmas morning.

The new Hospital on Longwood Avenue was opened in the spring and the Convalescent Home Managers held their first meeting there in April, when they also enjoyed the privilege of being shown all over the fine buildings by Sister Caroline.

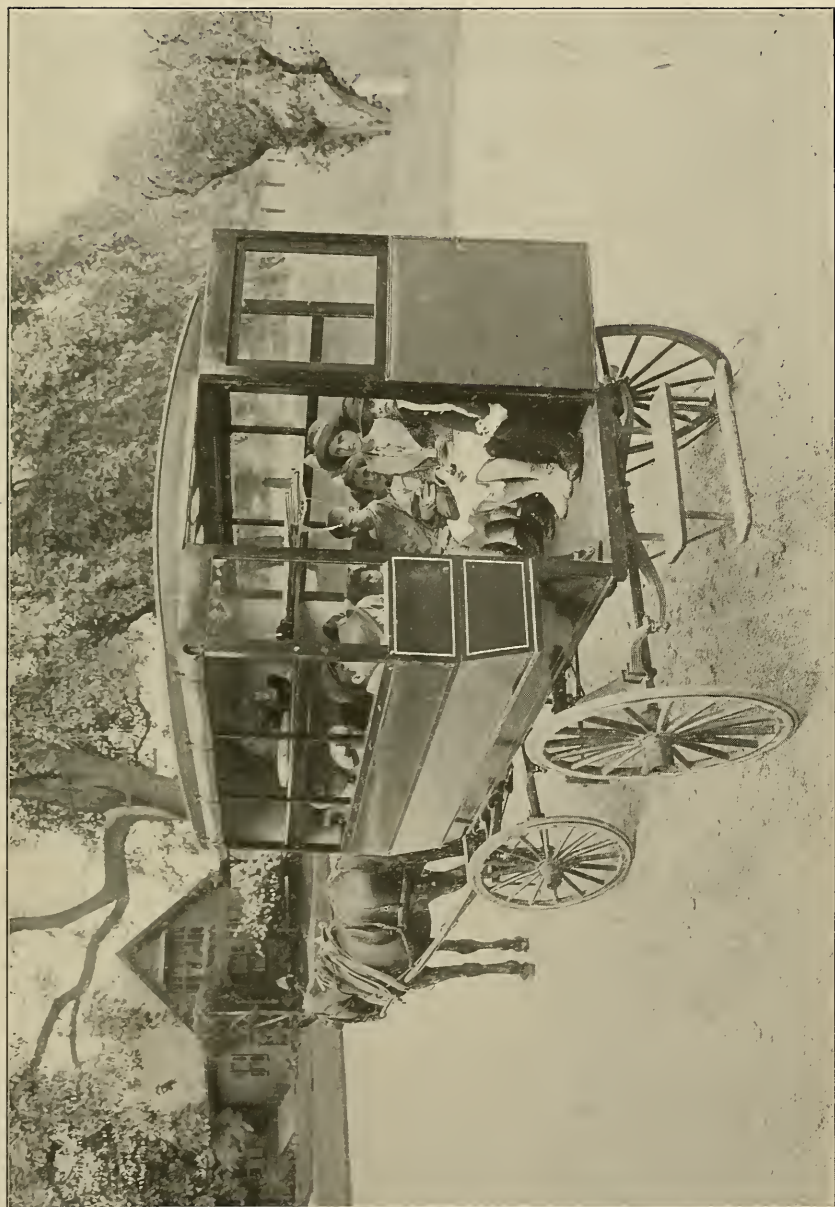

The Treasurer reports the receipt of generous gifts from various sources and Donation Day, which was held in May, netted a small amount of money, but owing to the stress of hard times, increased by the terrible war in Europe, and more especially because of the entire renovation of the drainage system, involving an expenditure of thousands of dollars, the treasury is in a very depleted condition. The work to be accomplished is so great and so necessary—more than ever necessary since the opening of a much larger Hospital, that the Managers must struggle on, although often in the face of great anxiety and discouragement, and they turn to the ever generous public for further donations and annual subscriptions—\$500 endows a Memorial Bed, and another form of subscription is to the Permanent Fund, established a few years ago with the gift of \$1,000.

The Managers, with a corps of volunteer helpers, meet at the Hospital on Tuesday mornings during the winter to cut out the very large amount of clothing, bed and table-linen and towels, needed in both Hospital and Home. Last winter 7,769 articles were cut out, and distributed to poor women to be made up. In addition to this work the Convalescent Home provides all the boots, stockings, sweaters, blankets and all other ready-made articles for both institutions.

Visitors are always welcome at the Home, which is situated on Forest Street, Wellesley Hills, and it is a pleasant sight on a pleasant day to see the children assembled in the playroom, or more probably on the large piazzas to the South, where even the most hopeless and pitiful of them can bask a few hours in God's gifts of sunshine and fresh air.

MARY B. HUNNEWELL,
Secretary.

December, 1914.

OFFICERS OF THE CONVALESCENT HOME

President

MRS. GEORGE H. MONKS 67 Marlborough Street

THE CONVALESCENT HOME

Extract from the By-Laws.—The name of this Corporation shall be "The Convalescent Home." Its objects are to aid in the carrying on of The Children's Hospital in Boston, as well as to carry on and manage The Children's Convalescent Home at Wellesley Hills, and to care for, relieve, and nurse such children—patients from that Hospital—as may be sent to this Home.

SUBSCRIPTIONS FOR 1914
